# <u>Comments on joined testimonies and documents</u> (sample selection)

#### Hemoglobin

1) A mature person with postoperative anemia. This took place in the fall of 1985, when doctors were reluctant to transfuse blood without severe necessity because of the blood-contaminated problem. On 1985/11/13 and 1985/20/13, hemoglobin level of that person was still stagnating, three months after operation, around 7 g/100ml. The doctors where about to transfuse blood anyhow when the person heard the 'melody' of hemoglobin only twice over the phone, on dec. 12, 1985. The person immediately felt relieved. Four days later, the blood tests confirmed that hemoglobin was back to normal at 2,7 g/100ml. (Story told in Dr.Fukagawa's book).

2) A child with anemia prior to surgery. On the morning of june 3, 1996, at 11 a.m. the blood tests showed hemoglobin level to be 8.1 g/100ml. The boy then listened to hemoglobin, together with ferredoxin and erythropoietin melodies, which her mother had made him listen to, at two different times. At 5 p.m., just before surgery, a control test showed hemoglobin nearly back to normal, at 12.4 g/100ml. (The particular action of erythropoietin ahead of red blood cells renewal could be appreciated here in the fact that leucocytes went down from 7300 to 4500 per cubic millimeter, while hematies almost proportionnally went up from 3250000 to 4540000 per cubic millimeter, as a characteristic scaling wave effect).

#### Rhinovirus inhibitor

- 3) A young man with common cold. Translation of testimony: "since a few days I had a rather important cold, with all the well-known characteristics. After listening once to rhinovirus inhibitor, there was an immediate effect, in that may nose stopped running in two minutes. There remained only a slight fever which disappeared after listening to histone 4, leaving room to a sensation of protective heat, like a wool". Signed Marc Carrère, 1999/10/5.
- 4) A mature man with common cold. Testimony of M. Lempereur, flutist, 1999/11/25: "I had a nose running this afternoon. Arriving at J.'s place, he tells me: 'Sounds like you caught a rhinovirus'. May be, so I listen to rhinovirus inhibitor (envelope protein of rhinovirus 14). After which my respiration goes back to normal. I also notice a small inexactitude on the score written by J., who agrees and modifies the position of measure bars".

Remark: M. Lempereur confirmed that such a cold never came back since. In march 2001 however, he had again a nose running; this time he did not 'recognize' the listening of rhinovirus inhibitor, nor of influenza A, but he did 'recognize' that of influenza B inhibitor, which he listened to twice and the running stopped.
